

Internship Application Tracking System – DBMS Project Plan (Points)

1. Project Overview:

- A system to track internship applications
- Stores application details and status
- Helps students monitor progress

2. Front-End Flow:

- Home Page:
 - Options: Register / Login
- Registration Page:
 - Input: Name, Email, Password, Phone
 - Data saved in database
- Login Page:
 - Input: Email and Password
 - Validates user and redirects to dashboard
- Dashboard (After Login):
 - Displays:

- Total applications
 - Pending
 - Applied
 - Delayed
 - Successful
-
- Add Application Form:
 - Fields:
 - Application Name (Company Name)
 - Role
 - Date Applied
 - Status (Pending / Applied / Delayed / Successful)
-
- View Applications:
 - Shows all applications in table format
-
- Update/Delete:
 - Edit application status
 - Delete application

3. Back-End Operations:

- Authentication:
 - Verify login credentials from database

- Insert Operation:
 - Add new internship application

- Fetch Operation:
 - Retrieve user-specific applications

- Update Operation:
 - Modify status (e.g., Pending → Successful)

- Delete Operation:
 - Remove application record

4. Database Design:

- Table 1: Users
 - user_id (Primary Key)
 - name
 - email
 - password

- phone

- Table 2: Applications

- app_id (Primary Key)

- user_id (Foreign Key)

- application_name (Company Name)

- role

- applied_date

- status (Pending / Applied / Delayed / Successful)

5. Relationship:

- One user can have many applications (1:N relationship)

6. System Flow (Step-by-Step):

- User opens website

- Registers account

- Logs in

- Dashboard is displayed

- User adds application details

- Data stored in Applications table

- User can view, update, or delete records

7. Technologies Used:

- Frontend: HTML, CSS, JavaScript
- Backend: Python
- Database: MySQL

8. Extra Features (Optional):

- Search applications by company name
- Filter by status
- Color indicators for status

9. Final Explanation Line:

- This project allows users to register, log in, and track internship applications with different statuses using a structured database system.
